

the 36 subgroups between H and S , grey; the 10 that keep the bonds, black; the chain $H < G_6 < G_{12} < B$, gold

the bond interval $[H, B]$: 10 subgroups, 17 covers, every node written by its generators, so each step up adjoins one generator; the same chain in gold

versions G_{12}/H : the same positions, position j carries label $g(j)$
