

shape frozen at $\mathbf{X}_0$: one version

H

symmetry $H = \{E, b\}$

let τ and ι move
 $\longrightarrow$
 freeze them again

shape free along the family: six versions G_{12}/H

H

symmetry $G_{12} = \langle b, t, u \rangle \supset G_6 = \langle b, t \rangle$

rigid level: a species of H , its spin weight

tunnelling multiplet $\text{Ind}_H^{G_6}$: species of G_6 , their weights

even parity; no energies: the order within a multiplet is not an energy order
