

methyl and amino,
two fragments

X_0 and its half-turn axis

$bX_0 = X_0P_b = R_bX_0$,
so $H = \{E, b\}$

the mirror
plane edge-on

the 36 subgroups between H and S , grey; the 10 that keep the bonds, black; the chain $H < G_6 < G_{12} < B$, blue

keep the
bonds
→

the bond interval $[H, B]$: 10 subgroups,
17 covers, every node written by its
generators, so each step up adjoins
one generator; the same chain in blue

versions G_{12}/H : the same positions, position j carries label $g(j)$

H
 $g = E$

tH
 $g = t$

t^2H
 $g = t^2$

uH
 $g = u$

tuH
 $g = tu$

t^2uH
 $g = t^2u$
