

τ around
η along the height
Q across the wall

the band at mid-thickness is the reference family $X_0(\tau, \eta)$; its six version points are gold, faded where the wall hides them

two paths from H: t in blue along the top edge, through the eclipsed point at $\tau = \pi/3$; tu in red through the band to the lower edge

the cut face is a normal slice at $q = (\tau, \eta)$: the points $X_0(q) + \sum_a Q_a e_a(q)$, $|Q| < \varepsilon$; the band's η-line in blue, the cut wall hatched

the same two paths followed below, seen down the C–N axis: N in front with its hydrogens on rods, C behind with its hydrogens from the rim; the digits are the column labels

tuH $\tau = -\pi/3,\ \eta = -\eta_0$ — H $\tau = 0,\ \eta = \eta_0$ — eclipsed $\tau = \pi/3,\ \eta = \eta_0$ — tH $\tau = 2\pi/3,\ \eta = \eta_0$
