

$\mathbf{X}_0$ in its body frame $SO(3)$ as a ball, direction the axis and distance the angle:
the twelve rotations of T , the cell $\mathcal{U}$ at $q = 0$, the lift $r \rightarrow r\mathbf{R}_g$

... twelve sheets, one per rotation of T

the covering $SO(3) \rightarrow SO(3)/T$ as in Figure 11:

the lift of ℓ_g runs from sheet r to sheet $r\mathbf{R}_g$;

A sees 1, 1E sees ω , 2E sees ω^2 ,

T cycles x, y, z
