

a product value: spin up on the nucleus labelled 1, spin down on 2, the oxygen spinless

the same points of space with the same spins; only the digits moved, and a proton exchange changes the sign

every column sent through the origin, digits and spins unchanged; parity is a separate character, χ_{stat} ignores the star; planar, so $-X$ is also a rotated copy

$\Psi(\sigma X) \sim \chi_{\text{stat}}(\sigma) \sigma \cdot \Psi(X)$ and $\Psi(E^* X) \sim \pm \Psi(X)$, the two conditions that cut $\mathcal{H}$ out of $\mathcal{H}_{\text{ambient}}$
