

the same $\mathcal{H}_{\text{spin}}$ over every X : on each fibre the value $\Psi(X)$, as its two components

$\xi = \uparrow\downarrow \omega$ and $\eta = \downarrow\uparrow \omega$ are orthonormal in $\mathcal{H}_{\text{spin}} = \mathbb{C}^2 \otimes \mathbb{C}^2 \otimes \mathbb{C}^1$ for $(^1\text{H}, ^1\text{H}, ^{16}\text{O})$; the values are one continuous representative, illustrative; $\Psi \sim \Phi$ when $\int \|\Psi - \Phi\|^2 dX = 0$
