

X_0 : the mirror plane through H_1 , C, N and the axis normal to it; digits are the column labels 1–5 of the hydrogens

$bX_0 = X_0P_b$: column k moves to $-x_{b(k)}$: 2 to $-x_3$, 3 to $-x_2$, 4 to $-x_5$, 5 to $-x_4$; the half-turn R_bX_0 is the same, so $H = \{E, b\}$

the 36 subgroups between H and S in grey, the 10 keeping the bonds in black, the chain $H < G_6 < G_{12} < B$ in blue

keep the bonds

the bond interval $[H, B]$: 10 subgroups, 17 covers, the same chain in blue

versions G_{12}/H : the same positions; position j carries label $g(j)$, so only the digits change
