twelve sheets over V in six version pairs $\{gX,\ gbX\}$; a lift of ℓ_s from the sheet gX ends on the sheet gsX

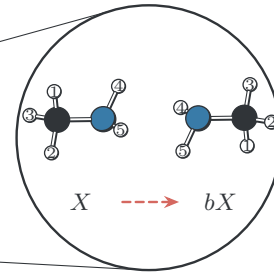

$t^3 = b^2 = E, \quad btb = t^{-1}, \quad bt = t^2 b \neq tb$

continuation along ℓ_s multiplies the sheet label on the right; on A_1 no change is seen, on E the noncommutativity remains

the six t, b-sheets as a graph, t in blue and b in red: t then b reaches tbX, b then t reaches $btX = t^2bX$, the gold nodes; the u-half is the same picture

the pair over $[X]$: $bX = -XP_{(23)(45)}$ is a different configuration, and no rotation carries X to bX (best-fit residual 0.76 Å); H stabilises the orbit of X_0, not the point X; the action is free near X_0 (nearest image 2.30 Å away)
