

one state, two bases: $|r, \tau, Q\rangle_0$ and $|JMK, m, p\rangle$, related by the Wigner–Fourier transform on $SO(3) \times S^1 \times \mathbb{R}^d$ with the chart density absorbed, $\tilde{\psi} = \mathcal{J}^{1/2}\psi$; no energies are assigned

level rules as in Harter (1993) fig. 4.2.3: a single rule for a one-dimensional species, a double rule for the two-dimensional E ; the modes with $3 \mid m$ are visibly invariant under the third-turn t : $m = 0$ gives A_1 , and $m = 3, 6$ split into A_1 (cos) and A_2 (sin); every other (cos, sin) pair spans one E
